

HITACHI MOS INTEGRATED CIRCUIT HD3101

DESCRIPTIONS

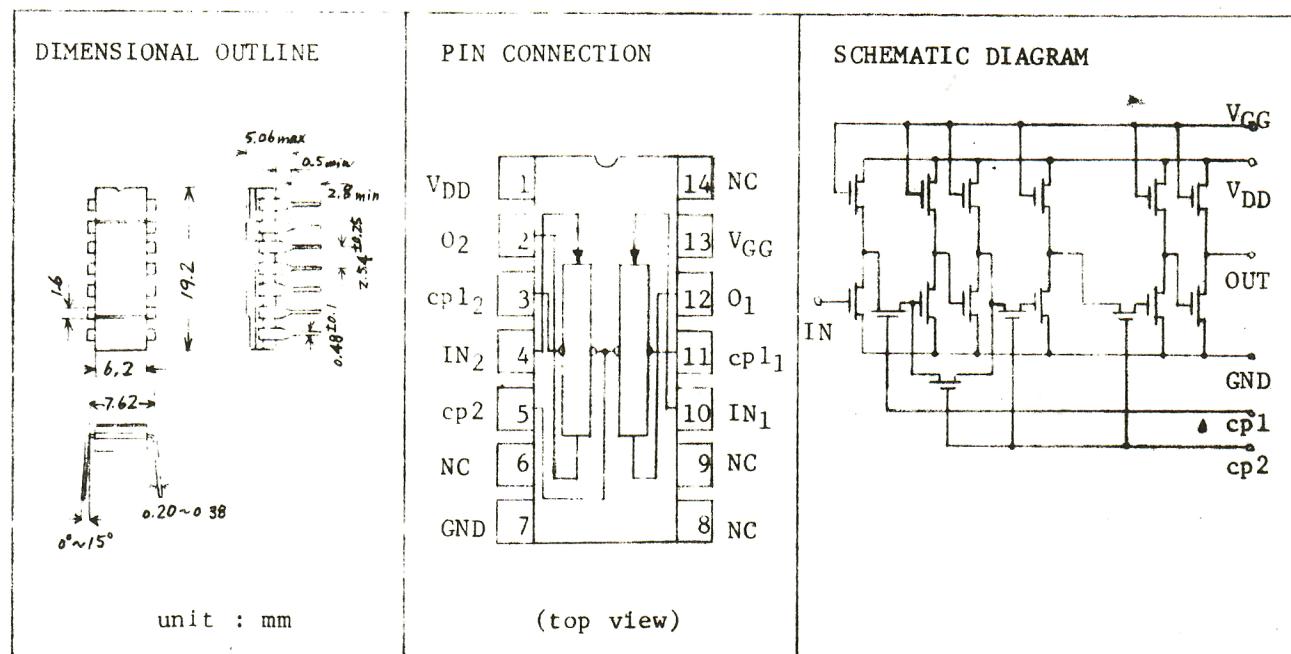

The HITACHI MOS (Metal Oxide Semiconductor) Integrated Circuit HD3101 is a dual 8 bits quasi-static shift register constructed on a silicon monolithic chip utilizing P-channel enhancement mode MOS transistors, belongs to HITACHI MOS IC HD3100 series especially designed for applications in an electronic desk calculator.

And HD3101 is available in a dual in line type ceramic package (14 leads).

The HD3101 functions as an 8 or 16 bits shift register, an 8 or 16 bits ring counter, and others.

The features of HD3101 are as follows:

- Integrated zener clamp protects gates.
- Large noise margin $NML = 1.0V$, $NMH = 2.0V$
- Wide operating frequency range DC to 100 kHz.
- Wide operating temperature range $-20^{\circ}C$ to $+75^{\circ}C$.

ABSOLUTE MAXIMUM RATINGS at $25^{\circ}C$ ambient temperature

HITACHI MOS INTEGRATED CIRCUIT HD3103

DESCRIPTIONS

The HITACHI MOS (Metal Oxide Semiconductor) Integrated Circuit HD3103 is a five MOS FETs constructed on a silicon monolithic chip utilizing P-channel enhancement mode MOS transistors, belongsto HITACHI MOS IC HD3100 series especially designed for applications in an electronic desk calculator. And HD3103 is available in a dual in line type ceramic package (16 leads).

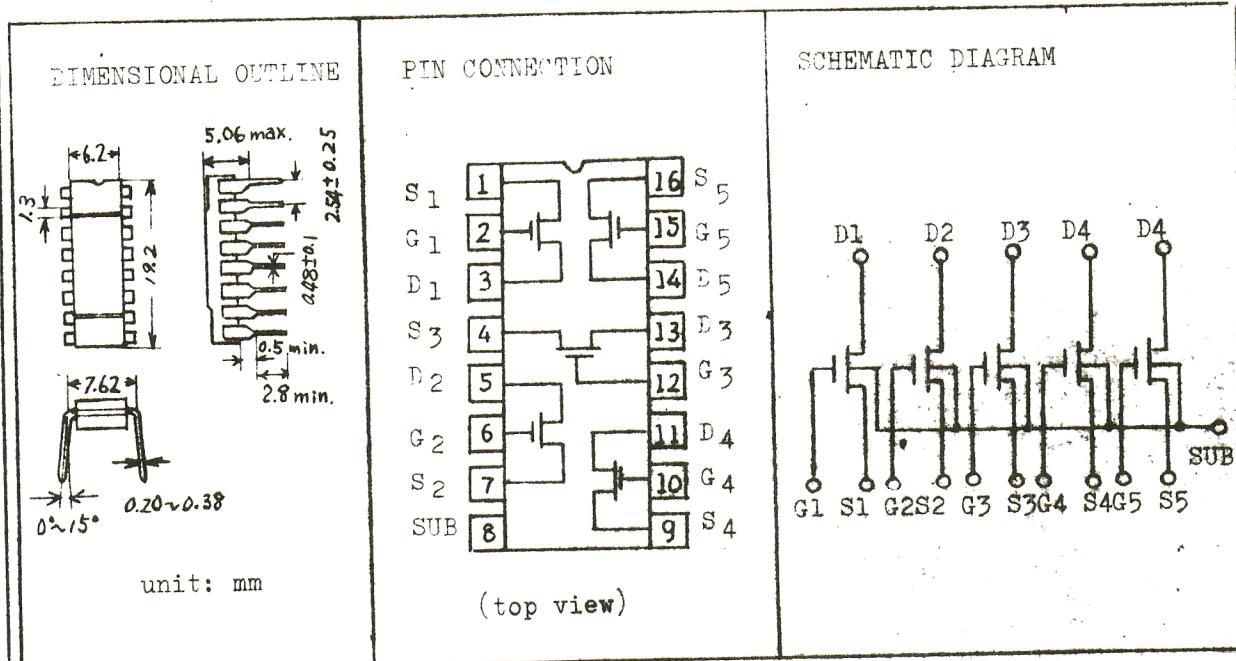

The HD3103 functions as a transfer gate, an inverter, exclusive OR circuits, and others.

The features of HD3103 are as follows :

Integrated zener clamp protects gates.

Large noise margin NML = 10.0V, NMH = 1.5V

Wide operating temperature range -20°C to +75°C

ABSOLUTE MAXIMUM RATINGS at 25°C ambient temperature

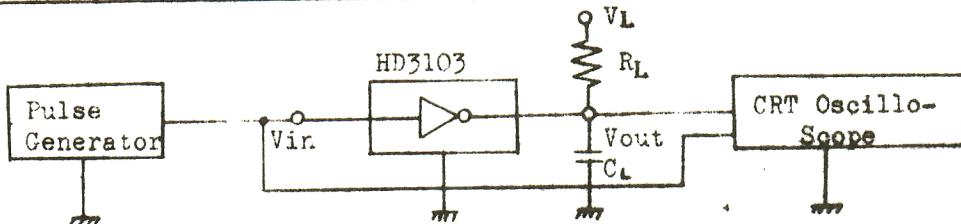

ITEMS	SYMBOLS	RATINGS	UNITS

HITACHI MOS INTEGRATED CIRCUIT HD3107

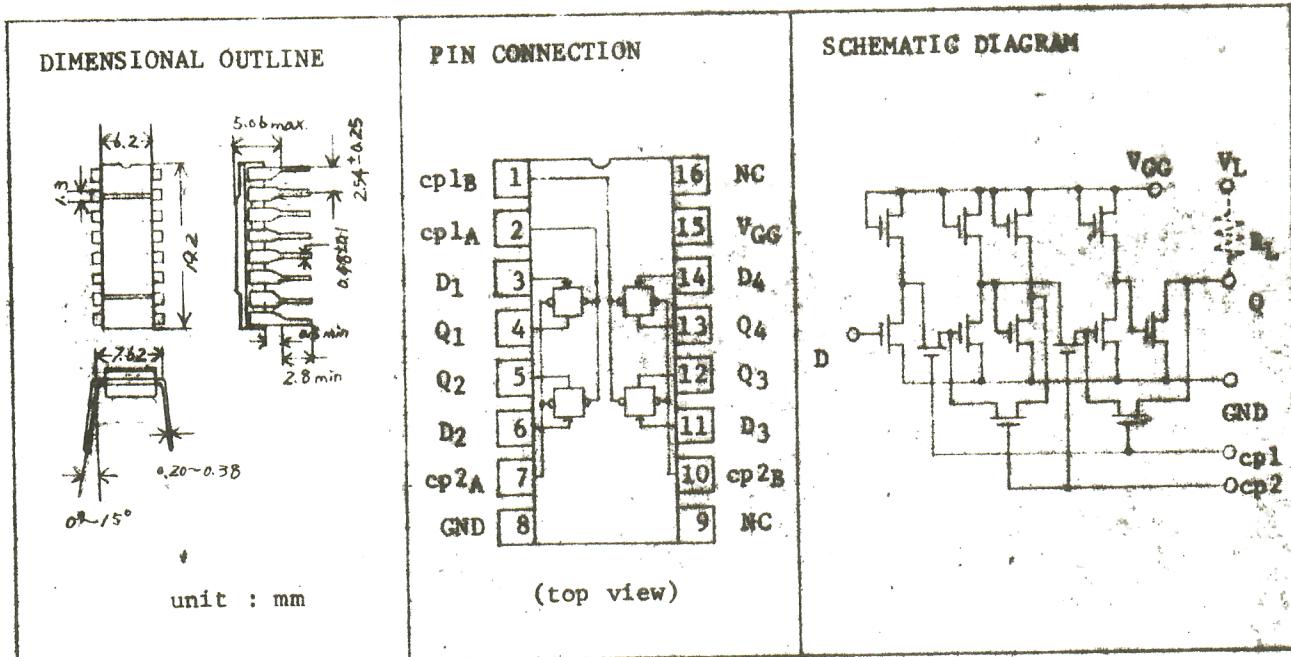

DESCRIPTIONS

The HITACHI MOS (Metal Oxide Semiconductor) Integrated Circuit HD3107 is a quadruple quasi-static delayed flip flop constructed on a silicon monolithic chip utilizing P-channel enhancement mode MOS transistors, belongs to HITACHI MOS IC HD3100 series especially designed for applications in an electronic desk calculator. And HD3107 is available in a dual in line type ceramic package (16 leads).

The HD3107 functions as a 4 bits static D flip flop, a 4 bits parallel in parallel out static shift register, a 4 bits ring counter, and

The features of HD3107 are as follows:

- Integrated zener clamp protects gates.
- Large noise margin $V_{M_L} = 10.0V$, $V_{M_H} = 2.0V$
- Wide operating frequency range DC to 100 kHz.
- Wide operating temperature range $-20^{\circ}C$ to $+75^{\circ}C$.

HITACHI MOS INTEGRATED CIRCUIT HD3109

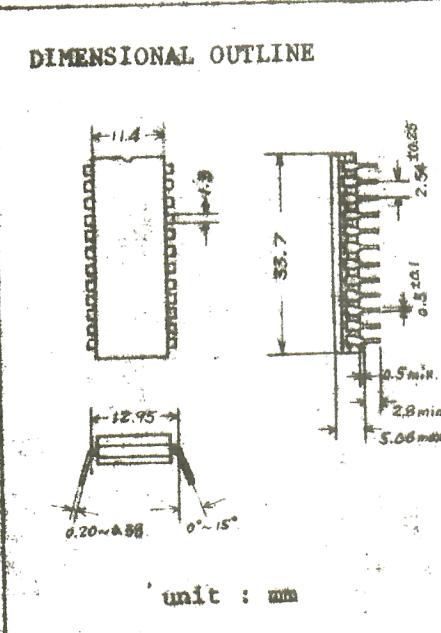

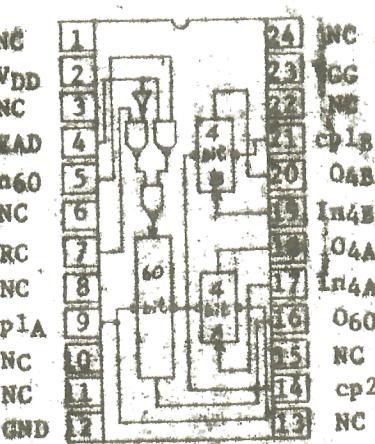

DESCRIPTIONS

The HITACHI MOS (Metal Oxide Semiconductor) Integrated Circuit HD3109 is a 60 + 4 + 4 bits dynamic shift register with control gate constructed on a silicon monolithic chip utilizing P-channel enhancement mode MOS transistors, belongs to HITACHI MOS IC HD3100 series especially designed for applications in an electronic desk calculator. And HD3109 is available in a dual in line type ceramic package (24 leads).

The HD3109 functions as a 4 bits dynamic shift register, a 60 bits dynamic shift register, a 64 bits or 68 bits dynamic shift register, and others.

The features of HD3109 are as follows:

- Integrated zener clamp protects gates.
- Large noise margin $V_{ML} = 1.0 \text{ V}$, $V_{MH} = 2.0 \text{ V}$
- Wide operating frequency range 10kHz to 100 kHz
- Wide operating temperature range -20°C to $+75^{\circ}\text{C}$

HITACHI MOS INTEGRATED CIRCUIT HD3112

DESCRIPTIONS

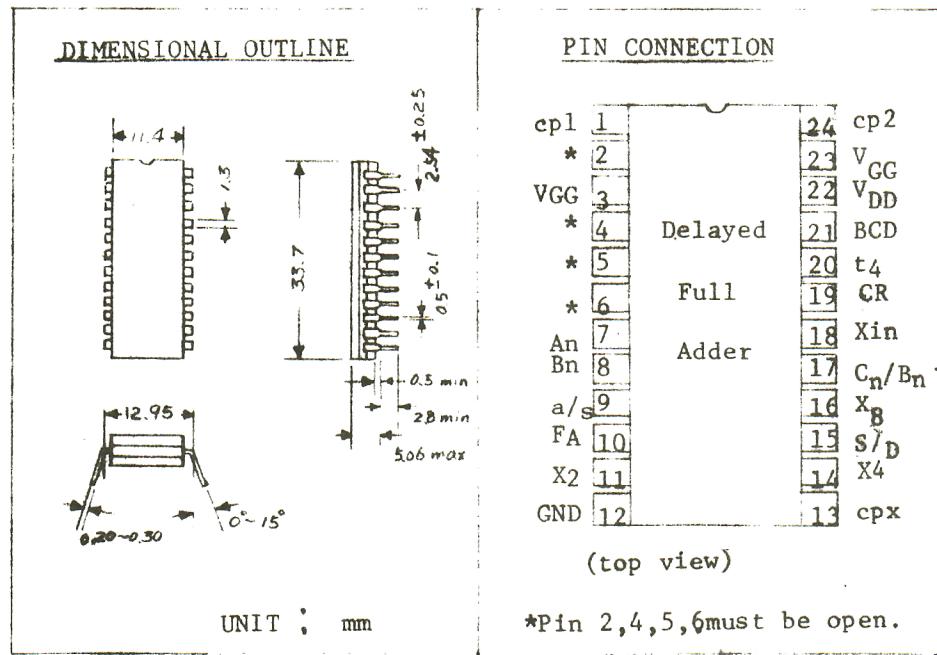

The HITACHI MOS (Metal Oxide Semiconductor) Integrated Circuit HD3112 is an integrated sub-system on a silicon monolithic chip utilizing P-channel enhancement mode MOS transistors, belongs to HITACHI MOS IC HD3100 series especially designed for applications in an electronic desk calculator.

And HD3112 is available in a dual-in-line type ceramic package (24 leads).

The HD3112 includes about 100 gates and performs the function of series delayed full Adder/ Subtractor.

The features of HD3112 are as follows:

- Integrated zener clamp protects gates.
- Large noise margin..... $NML \geq 2V$, $NMH \geq 2V$
- Wide operating frequency range..... DC to 100KHz.
- Wide operating temperature range..... $-20^{\circ}C$ to $+75^{\circ}C$.

	tp_{LH}		7.0		μs	

NOTE: C_p1 is controllable when C_p2 is given at from 10KHz to 100KHz repetition rate.

C_p2 is uncontrollable and always must be given at from 10KHz to 100KHz repetition rate.

CL includes a stray capacitance of a probe and wirings.

HITACHI MOS INTEGRATED CIRCUIT HD3115

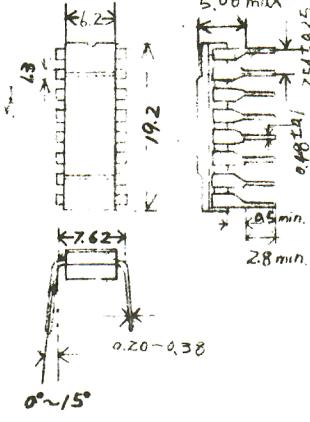

DESCRIPTIONS

The HITACHI MOS (Metal Oxide Semiconductor) Integrated Circuit HD3115 is a triple quasi-static R-S-S flip flop constructed on a silicon monolithic chip utilizing P-channel enhancement mode MOS transistors, belongs to HITACHI MOS IC HD3100 series especially designed for applications in an electronic desk calculator. And HD3115 is available in a dual in line type ceramic package (16 leads).

The HD3115 functions as a R-S-S flip flop, a counter, a memory, and others.

The features of HD3115 are as follows:

- Integrated zener clamp protects gates.
- Large noise margin $V_{ML} = 10.0V$, $V_{MH} = 2.0V$
- Wide operating frequency range DC to 100kHz.
- Wide operating temperature range $-20^{\circ}C$ to $+75^{\circ}C$.

ELECTRICAL CHARACTERISTICS

($-V_{GG}=24V \pm 10\%$, $T_a=25^\circ C$, $-V_L=-V_{GG}$)

ITEMS	SYMBOLS	MIN.	TYP.	MAX.	UNITS	CONDITIONS
Input Voltage	"0" Level	$-V_{IL}$	9.0		V	$T_a=75^\circ C$
	"1" Level	$-V_{IH}$		4.0	V	
Output Voltage	"0" Level	$-V_{OL}$	19		V	$R_L=200K\Omega$ $T_a=75^\circ C$, $cpw=1.0\mu s$
	"1" Level	$-V_{OH}$		2.0	V	
Clock Voltage	"0" Level	$-V_{CPL}$	19	26.4	V	$R_L=20K\Omega$ $f_{cp}=5kHz$
	"1" Level	$-V_{CPH}$		4.0	V	
Min. Clock Frequency	Clock 1	f_{cp1min}		0	Hz	$f_{cp2}=5kHz$ $cpw=1.0\mu s$
	Clock 2	f_{cp2min}		0	Hz	
Clock Pulse Width	cpw	1.0			μs	
Clock Pulse Delay	cpd'	1.0			μs	
Clock Capacitance	C_{cp}		13		pF	$f=1MHz$, $-V_{cp}=0V$
Input Resistance	R_{in}	1.0			MΩ	$-V_{in}=26.4V$
Input Capacitance	C_{in}		6.0		pF	$f=1MHz$, $-V_{in}=0V$
Output Capacitance	C_{out}		8.0		pF	$f=1MHz$, $-V_{out}=0V$
Power Dissipations	P_d		100		mW	$-V_{GG}=-V_{cp}=24V$, $-V_{in}=14V$ ($S=R$)
Propagation falling Delay Time	t_{PHL}		2.0		μs	$-V_{in}=0 \sim 12.6V$, $f_{cp}=10kHz$,
Delay Time rising	t_{PLH}		2.0		μs	$R_L=20K\Omega$, $C_L=20pF$, $cpw=1\mu s$

NOTE : cpl and $cp2$ are both controllable, and when cpl is controlled, $cp2$ must be given at from 5 kHz to 100kHz repetition rate, and when $cp2$ is controlled, cpl must be given at from 5 kHz to 100kHz repetition rate.

C_L includes a stray capacitance of a probe and wirings.
